Flawless Exit

For over 20 years

[people=positive™](#) has been supporting development projects on and offshore in the Oil & Gas sector. In the early 90's we worked with teams on the Gannet field development, on Curlew with the first ESP technology in the North Sea, on major re-development projects in the Brent field, Buzzard and Clair. Our global experience has included involvement in Sakhalin Island with Exxonmobil and with LNG projects for Qatargas. Currently we are supporting several mega-construction projects in Papua New Guinea and offshore Abu Dhabi in the Upper-Zakum field.

In all of these **smart-track**© projects, the same principles applied in achieving Flawless **Start-Up** are easily transferred to the decommissioning arena where 'Flawless **Exit**' becomes the goal. Focus will still be around putting effort into bringing key stakeholders together from the outset of the project to build strong collaborative relationships and to facilitate integrated working at all levels. The themes will still be about working in a way that delivers 'No Surprises' - avoiding problems down the line where safety may be compromised and where change becomes costly, time-consuming.

In North Sea decommissioning we are already involved with a number of projects where the goal is now 'Flawless Exit'. We work with project leaders to design interventions at staged intervals throughout the project life-cycle and provide performance coaching support to individuals and teams involved across the project.
